

## Senate Select Committee on Adopting Artificial Intelligence (AI)

By email: [aicommitee.sen@aph.gov.au](mailto:aicommitee.sen@aph.gov.au)

**Friday 17 May 2024**

Dear Senator Sheldon,

The Digital Industry Group Inc. (DIGI) thanks you for the opportunity to provide our views to the Committee's inquiry into Adopting Artificial Intelligence (AI).

By way of background, DIGI is a non-profit industry association that advocates for the interests of the digital industry in Australia. DIGI's founding members are Apple, Discord, eBay, Google, Linktree, Meta, Microsoft, Snap, Spotify, TikTok, Twitch, X (f.k.a Twitter), and Yahoo. DIGI's vision is a thriving Australian digitally-enabled economy that fosters innovation, a growing selection of digital products and services, and where online safety and privacy are protected.

DIGI welcomes the work of the Australian Government to realise Australia's potential as a responsible and inclusive Artificial Intelligence (AI) leader, as the development of digital technology is essential to Australia's continued economic prosperity.

DIGI also participated in the consultation led by the Department of Industry, Science and Resources on the *Safe and responsible AI in Australia* Discussion Paper. Our input to that process is relevant to many of the topics within the scope of the Committee's inquiry. Our full submission to the consultation, which may provide a helpful, supplementary reference to the points raised in this submission, can be found on our website.<sup>1</sup>

DIGI welcomed the response put forth in the Australian Government's *Interim Response to the Safe and responsible AI in Australia Consultation* and agrees with the assessment that 'AI can create new jobs, power new industries, boost productivity and benefit consumers'.<sup>2</sup> There are significant economic and social opportunities in the development of new technologies such as Artificial Intelligence (AI) and its applications, such as Automated Decision Making (ADM), large language models (LLM), and Multimodal Foundation Model (MfM). It's been estimated that adopting AI and automation could add an additional \$170 billion to \$600 billion a year to Australia's GDP by 2030.<sup>3</sup> In 2019, *Australia's Digital Opportunity*, a report produced by AlphaBeta (now Accenture) and commissioned by DIGI,<sup>4</sup> quantified the extraordinary contribution of Australia's technology sector to the national economy. It found that, at that point in time,

---

<sup>1</sup> DIGI 2023, *Safe and responsible AI in Australia Discussion paper | Submission to Department of Industry, Science and Resources*, <https://digi.org.au/wp-content/uploads/2023/10/16-August-2023-DIGI-submission-safe-and-responsible-AI-in-Australia-Discussion-paper-2.pdf>

<sup>2</sup> Australian Government 2024, *Interim Response* [https://storage.googleapis.com/converlens-au-industry/industry/p/prj2452c8e24d7a400c72429/public\\_assets/safe-and-responsible-ai-in-australia-governments-interim-response.pdf](https://storage.googleapis.com/converlens-au-industry/industry/p/prj2452c8e24d7a400c72429/public_assets/safe-and-responsible-ai-in-australia-governments-interim-response.pdf)

<sup>3</sup> Taylor et al., 'Australia's automation opportunity: Reigniting productivity and inclusive income growth', McKinsey & Company, 3 March 2019 <https://www.mckinsey.com/featured-insights/future-of-work/australias-automation-opportunity-reigniting-productivity-and-inclusive-income-growth>

<sup>4</sup> Unless otherwise noted, all statistics from this section are from AlphaBeta (2019), *Australia's Digital Opportunity*, accessed at: <https://digi.org.au/wp-content/uploads/2019/09/Australias-Digital-Opportunity.pdf>

the technology sector contributed \$122 billion each year to the national economy, or 6.6% of GDP. A subsequent estimate by Accenture in 2021 found that the tech sector contributed \$167bn, or 8.5%, of GDP, demonstrating the rapid growth of the sector.<sup>5</sup>

Australia has not fully leveraged the economic opportunity of the technology sector and, in 2019, ranked second last in the OECD for gross value added for the size of its technology sector. Domestic regulatory settings will directly influence the ability for Australia to access these opportunities and remain competitive on the global stage. Looking ahead, it is essential that the Government strikes the right balance in regulatory response to create the conditions where Australia can remain competitive on the global stage and take full advantage of the opportunities presented by AI.

DIGI supports development of AI, and its applications, underpinned by strong safety principles and a conscious assessment of social and economic benefits. We note that this work is already well underway across government and by industry. It can be seen in many existing internal governance measures to deliver trustworthy and safe AI technology, such as internal and external security testing before the release of new AI systems or voluntary research to understand and prevent system bias. We also note that international collaboration on ensuring responsible AI adoption continues to advance. In November 2023, Australia joined 27 countries in signing the Bletchley Declaration, committing to international collaboration on AI safety testing and the building of risk-based frameworks across countries to ensure AI safety and transparency. AI can support better decision-making, public safety and more inclusive and informed societies. DIGI also acknowledges the capacity for unintended consequences in perpetuating biases and other risks. We believe that a coordinated, proportionate response across government can address potential harms and mitigate risk related to AI, while supporting local innovation.

Our main arguments in this submission are:

1. **There are significant economic and social opportunities for Australia in the development of AI.**
  - a. The growth of AI technologies has the potential to create jobs, boost productivity, and increase prosperity and wellbeing for Australians.
2. **Policy responses should consider Australia's economic competitive advantage, as well as international interoperability and coordination.**
  - a. AI technologies are being developed at a global scale. Any regulatory developments should carefully consider all economic implications, including the competitiveness of Australian business, the ease of conducting international business, and implications with Australia's international trade partners.
  - b. Global governance of AI is in flux and DIGI recommends that the Government remains cautious of replicating any one international model until its efficacy can be better assessed.
3. **DIGI supports a proportionate, balanced approach to AI regulation, which is key to mitigating and addressing potential risks related to the use of AI, while accessing the technology's significant socio-economic benefits.**
  - a. It's important to recognise many uses of AI systems in Australia are already subject to regulatory frameworks.
  - b. DIGI supports the clarification and strengthening of existing laws to address potential risks related to AI.
    - i. We recommend further regulatory analysis to produce sector-specific guidance and gap analysis to inform legislative reform, where new rules may be necessary, as well as voluntary processes to better account for potential risks related to the application of AI.
  - c. DIGI agrees with adopting a proportionate, risk-based framework to prevent and address issues related to the use of AI. DIGI has recommended that a risk framework addresses

<sup>5</sup> Accenture (2021), *The economic contribution of Australia's tech sector*, accessed at <https://techcouncil.com.au/wp-content/uploads/2021/08/TCA-Tech-sectors-economic-contribution-full-res.pdf>

the mitigation of potential risks by identifying the defined harms or challenges in the supply chain and balancing responsibility between the upstream designers of AI models and technology and the downstream deployers.

We thank you for your consideration of the matters raised in this submission, and we look forward to further discussion with you. Should you have any questions, please do not hesitate to contact me or my colleague Tahlia Davies.

Best regards,

Sunita Bose  
Managing Director, DIGI

## The economic and social opportunities and benefits for Australia in the development of AI

### Definitions

There is no single agreed definition of AI. DIGI notes that the fast-paced evolution of the technology presents some challenges in reaching a detailed definition, as it can quickly become outdated in line with new developments. For clarity and coordination across domestic and international regulatory schemes, DIGI suggests that the Government adopt a common lexicon based on the OECD AI principles, upon which Australia engaged in the development.<sup>6</sup> For example, the principles outline the definition of an AI system as a 'machine-based system that can, for a given set of human-defined objectives, make predictions, recommendations, or decisions influencing real or virtual environments. AI systems are designed to operate with varying levels of autonomy'.<sup>7</sup> Adopting a common lexicon with other OECD countries could prove useful for future international engagement and consultation with Australia's allies and partners.

### Understanding the opportunities for Australia in AI technologies

The World Intellectual Property Organisation notes AI as an example of a 'frontier technology'.<sup>8</sup> These are rapidly emerging technologies that have enormous potential for both driving economic growth and addressing pressing social challenges.

How to access these opportunities while mitigating against risks and potential misuse is a question that governments, industry and civil society are grappling with around the globe. In its recent 2023 Global Education Monitoring Report, UNESCO summarised the global nature of this pursuit for balance in AI governance as 'a consensus (is) forming about the need to enjoy AI's benefits while eliminating risks from

---

<sup>6</sup> Ibid.

<sup>7</sup> OECD (2029), <https://legalinstruments.oecd.org/en/instruments/OECD-LEGAL-0449>

<sup>8</sup> World intellectual Property Organization 'What are frontier technologies; fact sheet' 2023

its unchecked use, through regulation relating to ethics, responsibility and safety'.<sup>9</sup> This submission will further explore DIGI's position on finding this balance.

Firstly, DIGI believes AI can support better decision-making, public safety and more inclusive and informed societies, in part because its deployment through algorithms and machine learning is already being used by a wide diversity of private sector industries and public sector departments for social benefits. Examples of the myriad of beneficial applications include:

- **Benefits to health:** AI is helping people attain better health and well-being; a report by PwC demonstrates how AI is already transforming eight components of the healthcare system, including preventative health, diagnosis, decision-making, palliative care, research and training.<sup>10</sup> As one example, Google's hearing technology partnerships are harnessing AI to develop listening and communications technology.<sup>11</sup> A Microsoft charitable initiative, [AI for Health](#), assists nonprofits, researchers, and organizations tackling worldwide health issues across three principal domains of population health, imaging analytics, and genomics & proteomics.
- **Disability access and services:** AI is transforming inclusion and access to services for people with disabilities and the elderly. AI-powered devices that use voice commands, such as Google Home and Google Assistant technology<sup>12</sup> are being used by people with limited sight or mobility<sup>13</sup>, and Meta uses AI to automatically write photo captions for the blind and visually impaired.<sup>14</sup> Microsoft has enabled new accessibility skills into Copilot for Windows and is empowering creators to build accessible content in M365.<sup>15</sup>
- **Environmental analysis and crisis planning:** AI is being used to better predict impacts of environmental changes or natural disasters. For example, AI is being deployed to and support climate resilience planning.<sup>16</sup> Google is also supporting research and development of flood forecasting through its Impact Challenge programme.<sup>17</sup> Microsoft's AI for Good Lab, partnering with Planet and the Institute for Health Metrics and Evaluation (IHME) employs satellite imagery and AI to produce high-resolution population maps for better climate-event resilience.<sup>18</sup>
- **Entertainment and cultural material:** Machine learning has long powered curation and recommendations for videos, music, and textual works. For example, AI is used by music streaming services to organise hundreds of millions of sound recordings and offer users

custom playlists, trivia, and other types of personalised music listening sessions. Microsoft is collaborating with individuals and organisations to leverage AI technology and resources as a catalyst for the preservation and enrichment of cultural heritage around the world.<sup>19</sup>

DIGI also considers that there are significant economic opportunities in the development and adoption of AI. In addition to the examples outlined in this submission's opening letter, the Tech Council of Australia's *Australia's Generative AI opportunity report* estimated that generative AI alone could contribute \$45B annually to the Australian economy by 2030. In the medium and fast paced scenarios, this figure could be \$75B or \$115B respectively.<sup>20</sup> AI technologies do not just present industry growth opportunities, but also have significant potential to boost productivity, which is key to Australia's long term economic health. In February 2024, the Australian Productivity Commission reported that 'improvements in generative AI are expected to present opportunities for innovation in publicly provided services such as healthcare, education, disability and aged care, which not only account for a significant part of the Australian economy but also traditionally exhibit very low productivity growth'.<sup>21</sup> This highlights both the potential benefits of fostering local innovation and AI adoption, as well as the opportunity cost of not doing so. These are illustrative examples to demonstrate that there are significant socio-cultural opportunities in the development of AI technologies, as well as the potential to further grow Australia's economic prosperity.

DIGI also considers there are opportunities to maximise the benefits of AI for Australians through additional investment by Government in research and capability building. DIGI welcomed the Government's investment in industry analysis and the coordination of AI policy development to support the safe and responsible adoption and use of AI in the 2024-25 Budget. DIGI supports the Government's intention to build on its existing investment to grow our national capability to develop and adopt artificial intelligence, as outlined in the Australian Government's *Interim Response to the Safe and responsible AI in Australia Consultation*. DIGI has previously supported the \$75.7 million of funding for AI initiatives in the 2023-24 Budget and its allocation to the AI Adopt program, the National AI Centre, and Next Generation Artificial Intelligence and Emerging Technologies Graduates programs. Further investment by Government and private industry will help ensure Australia remains competitive on the global stage and is able to access the significant socio-economic benefits in the adoption of AI technologies. Additionally, the Australian Productivity Commission posited that investment in digital literacy 'would support both a more productive workforce and AI uptake'. The Government could also consider further investments in research to support labour transitions, as well as programs to ensure strong pipelines of STEM talent and a clear understanding of the skills that will be needed to support the future of work and to reach the Government's target of 1.2 million tech-related jobs by 2030.<sup>22</sup>

## The role of AI in online safety

Beyond the potential social and economic benefits, DIGI notes that AI also plays a key role in delivering relevant services and online safety mechanisms for many digital platforms. On relevant large digital platforms, AI and algorithms play an important role as a sorting mechanism for the millions of terabytes of information online, enabling people to readily obtain relevant content and information.

AI is also used to safeguard the safety and security of Internet users, and to address harmful content. Such technology is having a positive effect; In Q4 of 2023, approximately 99.6% of the comments

<sup>21</sup> Australian Productivity Commission (2024), Making the most of the AI opportunity, <https://www.pc.gov.au/research/completed/making-the-most-of-the-ai-opportunity/ai-paper1-productivity.pdf>

<sup>22</sup> August 2022, *Mapping out Australia's path to tech jobs future*, <https://www.minister.industry.gov.au/ministers/husic/media-releases/mapping-out-australias-path-tech-jobs-future>

removed from YouTube were detected by automatic flagging. Automated flagging also allows videos that violate community guidelines to be removed before they are widely viewed. In the same quarter, 51.51% of the videos flagged by automation were removed before they received a single view.<sup>23</sup> Similarly, Meta uses artificial intelligence to proactively detect harmful content before it is seen by users. For example, Meta proactively detected 96.7% of child exploitation material in Q4 2023 before a user reported it.<sup>24</sup> Proactive detection is also being used extensively to identify and prevent scams targeting Australian consumers. For example, Gmail proactively blocks more than 99.9% of spam, phishing, and malware before it reaches users.<sup>25</sup>

The use of algorithms to promote online safety is consistent with the Government's expectations of industry. For example, the draft BOSE determination, which came into effect with the Online Safety Act (OSA) on January 23, 2022, identifies the detection of material and activity as a reasonable step service providers can take to ensure end users are safe.<sup>26</sup> The Office of the eSafety Commissioner's Safety by Design principles include "Using scanning and filtering technology to ensure user safety is upheld on the site and users are not exposed to inappropriate or sensitive content."<sup>27</sup> The registered *Social Media Services Online Safety Code (Class 1A and Class 1B Material)*, developed under the OSA, also includes use of artificial intelligence and machine learning as safety measures related to the detection and removal of child exploitation and pro-terror material.<sup>28</sup>

It is important to note that algorithms also do not operate in isolation from human intervention; in relation to content removal, it is often the case that AI surfaces problematic content for a human moderator to review for context and accuracy, and to guide the most effective decision. AI plays an important role in scanning content at a scale that humans could never achieve, at a speed which was previously not possible. It forms a key part of how online safety challenges are addressed at a large scale.

DIGI notes that a statutory review of the OSA (The Review) is being conducted this year, which will consider a broad range of issues, including the pertinence of AI technologies to online safety regulation. We look forward to closely engaging in the Review and urge the Committee and Government to undertake a holistic and coordinated approach to addressing issues of AI adoption and online safety.

## A focus on Australia's economic competitive advantage, international interoperability and coordination

### Australia's governance response and international models

DIGI recommends careful consideration of international interoperability and coordination on AI governance. Both development and governance of AI continues to evolve around the world. We recognise that in November 2023, Australia joined 27 countries in signing the Bletchley Declaration and that the Government has outlined its intention to monitor and work with partners to understand what approaches

<sup>28</sup> Schedule 1 – Social Media Services Online Safety Code (Class 1A and Class 1B Material) (2023) [https://onlinesafety.org.au/wp-content/uploads/2023/06/230616\\_1\\_SMS-Schedule\\_REGISTERED-160623.pdf](https://onlinesafety.org.au/wp-content/uploads/2023/06/230616_1_SMS-Schedule_REGISTERED-160623.pdf)

to adopting AI are being taken in key jurisdictions and in key international forums. Recent research by Resolve Strategic on Australians' attitudes to AI indicated an understanding that the technology is relevant to Australia's role in a global setting. The survey found that a majority (44 percent) believe AI should be regulated internationally rather than through a separate domestic approach. The results also considered options for domestic regulation alone or no regulation.<sup>29</sup>

There are many initiatives currently in development to introduce international standards, such as those produced by the ISO<sup>30</sup>, or novel regulation, such as the EU AI Act.<sup>31</sup> DIGI encourages the Government to consider global approaches, such as OECD initiatives, the Hiroshima Process led by G7, or the Global Partnership on AI. We believe there is benefit in identifying Australian expert stakeholders to represent domestic interests in these processes and welcomed the Government's intention to bolster the engagement of Australian experts in relevant international forums. This will ensure that Australia remains in step with international standards and is best placed to participate in the global ecosystem. However, DIGI recommends that the Government remains cautious of replicating any one international model until its efficacy can be better assessed. Looking at the EU AI Act, for example, it establishes a risk-based approach and seeks to promote transparency and balanced responsibility across the supply chain but its operation alongside existing sectoral and horizontal regulation remains unclear. Broad legislation focused on AI as a technology could, for example, present potential conflicts with existing legislation, creating uncertain conditions for business while potentially subjecting organisations to duplicative regulatory and reporting processes. It could also potentially introduce burdens on business, which will affect innovation and investment toward AI. DIGI encourages the Government to consider further examples of phased and sectoral approaches, such as the UK's pro-innovation model which adopts an outcomes based approach and first considers updates to existing regulatory schemes.<sup>32</sup> At a broader scale, DIGI recommends a cohesive approach to digital regulation that takes into account existing regulatory schemes and suggests the Government considers overarching principles to guide new technology policy development, such as the principles seen in the UK Digital Regulation Plan.<sup>33</sup> DIGI also recommends ongoing bilateral and multilateral engagement with like-minded governments and international bodies to inform future policy development.

The Australian Government should consider the need for flexibility and adaptability in any regulatory framework given AI's rapid development. There is an opportunity to consider international coordination on voluntary commitments, via open and transparent processes, inclusive of all parts of the AI supply chain. For example, multi-stakeholder partnerships in relation to watermarking and user notice on AI generated content. In advance of the United States' *Executive Order on Safe, Secure, and Trustworthy Artificial Intelligence*,<sup>34</sup> several major technology companies had already made voluntary commitments at the White House Summit under three key principles to guide AI governance: safety, security, trust.<sup>35</sup> These commitments range from testing protocols to user notice initiatives to help consumers better understand when they are interacting with an AI system or AI generated content. This approach highlights the commitments already underway by AI developers at a global scale to ensure the responsible development of the technology. It also demonstrates how industry and governments can collaborate to best determine

governance models for AI as the technology develops by harnessing the technical expertise and deep understanding of potential use cases. Further voluntary schemes are underway, including the *Tech Accord to Combat Deceptive Use of AI in 2024 Elections*, a set of commitments to deploy technology countering harmful AI-generated content meant to deceive voters.<sup>36</sup> Voluntary commitments allow speed and flexibility to adapt in a shifting technological ecosystem. Exploration of voluntary principles and frameworks will allow for a rapid and internationally coordinated approach to AI governance. It also has the potential to strengthen economic opportunities at a global scale by ensuring Australia does not lag behind or diverge from the approaches of its major trade partners.

AI technologies are being developed at a global scale. There is immense complexity and cross-economy implications to be considered in the implementation of any governance framework. Regulatory developments should carefully consider international partnership and relationships. The Government should consider international economic implications, including the competitiveness of Australian business and research capabilities, the ease of conducting international business, and implications with Australia's international trade partners. A heavy focus on domestic regulation without a clear consideration of international cooperation and harmonisation across multiple jurisdictions could create conditions where economic opportunities are missed without a meaningful reduction in risk. Australia's approach to international collaboration should also be considered more broadly, for example through partnerships that improve security or innovation by enabling trusted data flows across national borders for training purposes or best practice alignment on security practices.

International coordination and consultation will be essential to Australia's role in the global AI ecosystem and ensuring best practices in governance. However, while DIGI recognises that the Government will want to study emerging regulatory developments in overseas jurisdictions to inform domestic policy, we encourage a balanced approach with equal consideration of the Australian context, particularly the potential economic opportunities and barriers previously discussed in this submission. First and foremost, it is important that the Government considers the evidence base and nature of risk in relevant local use cases for the technology and the appropriate responses within existing local legislation.

## Clarity and coordination across Australia's AI governance

DIGI recommends that the Government ensures consistency and coordination in AI governance through a whole of Government response and clear guidance for regulators to reduce undue burden on industry and prevent barriers to innovation.

Regulatory settings and reform proposals across various regulators and Departments have direct implications on Australia's competitive advantage and economic prosperity. As previously noted, there are significant social and economic benefits in the adoption and development of AI that the Government should be cautious of curtailing. The Government should also consider the risks present in not fostering local innovation or development of AI technologies and the broad economic impacts including to Australia's long term prosperity and productivity. To best support innovative and responsible development of AI in Australia and effective safeguards for its deployment, DIGI recommends that there is clarity and consistency in how domestic regulators define and address risk related to the technology. This will reduce any potential uncertainty or undue burden on industry that might result from separate assessment and compliance requirements across different regulators. DIGI believes that first assessing the applicability of existing legal frameworks to the use of AI and asking the relevant regulator(s) to produce detailed, sector-specific, regulatory guidance, including on how organisations can adequately demonstrate compliance, supports business conditions.

---

<sup>36</sup> <https://www.aielectionsaccord.com/>

DIGI recommends the Government also considers how existing legislative settings might be best updated to allow for the innovative development of AI for the benefit of Australians. For example, Australia has a handful of restricted purpose based fair use exceptions for copyright infringement which, in our view, would benefit from adjustment to ensure that Australia can take advantage of the potential benefit of AI technologies. This is because the training and development of AI models often requires the input of copyrighted materials. By way of example, digital service providers are investing in research and development of innovative AI applications that can assist in the detection, removal and reporting of seriously harmful and illegal materials online, including pro-terror and child sexual abuse materials. Companies investing in these solutions need to be able to process large volumes of illegal materials, but also 'safe' legal materials so that the technology can learn to distinguish between the two. However, it is not clear to what extent the existing fair dealing exceptions in Australian law for private use would enable research and development of this nature. Rather than expanding exceptions on a piecemeal basis that may be difficult to keep up to date given the pace of digital innovation, we recommend considering a flexible exception that can fairly balance rightsholder and user interests as technologies evolve. Challenging questions also arise regarding the copyright in AI generated innovations. The Copyright Act 1968(Cth) does not expressly deal with the issue of the ownership of computer-generated works, although it is clear that there can be no copyright protection afforded to works under Australian law absent a human author.<sup>37</sup> It is currently unclear whether works that are created by an AI program would benefit from copyright protection. DIGI believes this is a clear example of how existing frameworks could and should be clarified and updated to address AI, in order to ensure that Australians benefit fully from the social and economic impact of the technology's applications.

## A proportionate, balanced approach to AI regulation to minimise risks and access opportunities

### Analysis of existing laws and producing sector specific guidance

As previously discussed, AI is already addressed by a number of existing laws. DIGI recommends that policy responses first build on existing regulation, rather than introducing new legislation aimed at regulating AI as a technology. Assessing the use of AI within sectorally relevant regulation will allow for the most contextually appropriate understanding of the application of the technology and its potential risks, while creating settings that foster innovation and the socio-economic benefits of the technology.

DIGI recommends the Government, and specifically sectoral and horizontal regulators, be resourced to assess to what extent AI is already regulated within the scope of existing laws in all the sectors where AI will be applied. For example, this should include relevant laws in healthcare, insurance and – in relation to the digital industry – the application of the Online Safety Act 2021 (OSA) to address AI proliferated online harms. The sector-specific guidance should be well-socialised by Government through a program of measurable outreach in relevant industries in order to ensure uptake. Gaps identified through this analysis should also feed into existing and future reform processes. For example, the Government can consider how potential privacy risks associated with AI could be addressed in the review of the *Privacy Act 1988* currently underway.<sup>38</sup> Guidance is also key to facilitating robust self assessment frameworks and delivering consistency as multiple industries assess and report on their use of AI technologies. DIGI highlights that these technologies will be used across the economy, not just by a small number of highly digitised companies.

The regulatory analysis previously outlined should inform sector-specific guidance that relevant regulators issue to the industries that they regulate around the application of existing laws to AI

technology, noting that the context in which AI is employed is key to understanding risk. This sector-specific guidance might encourage company policies or voluntary principles to address any gaps identified where existing regulation does not address identified harms proliferated through AI. The potential risks associated with the deployment of AI vary depending on the contextual application of the technology in a variety of sectors. For example, harms that might arise from use of AI in healthcare or the financial sector will vary greatly from those presented by use of AI in entertainment, which might inform the Government's prioritisation of resourcing regulators to undertake analysis and sector-specific regulatory guidance.

DIGI agrees with the need for risk-based frameworks for AI that take a proportionate approach to assessing risk, and that include a focus on where those risks occur and which applications can be defined as high risk (i.e. applications whose output is likely to cause significant direct material harm). Such frameworks should provide horizontal economy-wide guidance on good AI processes to support adoption, and flexibility to allow for tailored, sector- and application-specific regulation. We also believe that such frameworks have a role in promoting workable standards for explainability and transparency to promote confidence in AI technologies. In 2019, DIGI welcomed the release of the Australian Government's AI Ethics Principles in providing guidance to a wide range of companies using AI to prevent unintended consequences and ensure the highest standards of ethical business and good governance. These principles provide a helpful framework for companies across a wide range of sectors to ensure the ethical application of AI. DIGI supports continued promotion and adoption of the AI Ethics Framework. As noted, DIGI recommends that relevant regulators issue sectoral guidance on the application of their legislation to AI-proliferated harms. This guidance should also identify gaps that might be addressed through company-level policy and industry voluntary standards; in so doing, relevant regulators should consider the relevance of the existing AI ethics principles in these recommendations to relevant industries. DIGI looks forward to engaging with the Government on the development of a voluntary AI Safety Standard and voluntary labelling and watermarking of AI-generated materials, as outlined in the Australian Government's *Interim Response to the Safe and responsible AI in Australia Consultation*.

In developing risk assessments related to an application of AI, DIGI recommends that, through sectoral regulatory guidance or otherwise, the Government considers the roles and responsibilities of all entities involved in an AI value chain, including developers, integrators, downstream deployers, or downstream providers and adopt a shared responsibility model. Various stakeholders in the supply chain play a role in the safe and responsible development and deployment of AI. Impact assessments should be present for each of these intermediaries. Assessment, monitoring, documentation and reporting should be present and proportionate to the control of the entity. For example, the organisation deploying the technology is best placed to understand specific use cases for it and potential risks for that case. Relatedly, developers should provide deployers with a level of transparency that ensures essential information is shared to facilitate accurate assessment. While a developer cannot accurately assess the full potential risk of the technology without complete oversight of the context in which it will be deployed, safeguards can also be built into models upstream to help prevent a number of downstream risks. In order for these assessments to be functional, while protecting proprietary information, a model could be considered where there are proportionate and necessary safety and transparency requirements for each entity in the chain and intermediaries are responsible for safety requirements or transparency disclosures that relate to their specific use case. DIGI encourages further consultation with a range of industries, AI deployers and developers to ensure that any risk framework that is developed addresses the relevant risks in their sector, potential use cases, applications, and potential associated harms.

Many risks related to AI are also found in existing human systems and decisions; therefore an understanding of the most common risks at a sectoral level is conducive to effective governance, and should be the first step, prior to the consideration of how these same risks might be amplified through AI. Noting this, DIGI believes that the application of sectoral specific regulation is best placed to ensure safe development of AI as it can best address specific use cases of the technology. This applies to both public and private sector applications of the technology. We caution against recommendations for regulatory or

centralised bodies focused on reviewing the technology of AI itself, as such an approach may not give due weight or nor allow for sufficient expertise on contextual, sectoral application. DIGI further notes that any such proposal may face significant human resources challenges, as an extremely high level of both technological expertise in relation to AI would be required alongside highly in-depth, sector-specific knowledge of every industry and government vertical where AI is applied. A more scalable, technology-neutral approach lies in upskilling and resourcing all relevant, sectoral regulators and focussing regulatory effort against areas of highest risk. DIGI supports the establishment of an AI advisory body, which could provide regulators and policymakers with access to ongoing, multi-disciplinary, technical and regulatory expertise on AI. We encourage close consultation with industry, as well as other relevant stakeholders, in order to ensure diverse experience and adequate technical representation in the final composition of any such body.

## Conclusion

DIGI thanks the Committee for the opportunity to provide its views on adopting Artificial Intelligence and the significant opportunities it presents for Australians. We applaud the Australian Government's consultative approach and commitment to balancing the need to seize the opportunities presented by the development of AI, while ensuring safe and responsible use of the technology. DIGI considers that the full socio-economic benefits of adopting artificial intelligence remain yet unrealised and hold the potential to create jobs, boost productivity and increase prosperity for Australians. DIGI believes that it is essential that technological, ethical, and legal expertise is harnessed to design the most effective governance framework in relation to AI technology and its applications. We encourage the consideration of a proportionate, risk based approach to regulating AI that carefully considers the existing regulatory settings and cohesion across the whole of the government. We look forward to further engagement with the Government on the next steps of this important process, as well as the work being advanced by the Department of Industry, Science, and Resources and other relevant processes that will consider the role of AI, such as privacy law reforms and the review of the Online Safety Act.
